Shoreline System

A tropical beach scene with a sandy shore, turquoise water, and a line of palm trees under a blue sky with white clouds. The beach is in the foreground, leading to the water's edge. The sky is bright blue with scattered white clouds. The overall atmosphere is serene and idyllic.

Waves, Beaches, and Coasts

Wave Features

- **Wave height:** Vertical distance between the crest and trough of the wave.
 - Wave crest: Highest point on the wave.
 - Wave trough: Lowest point on the wave.
 - Ocean waves range 0.3 to 5 m; can be as high as 15 m.
- **Wavelength:** Horizontal distance between two wave crests or troughs.
 - Ocean waves range from 40 to 400 m.
- **Wave period:** Time for one wavelength to pass. This is inversely related to frequency $P = 1/f$.
 - Ocean wave velocities range from 25 to 90 km/hr.

Rip Currents

Rip currents: water that flows straight out to sea from the surf zone. Travel at the surface and die out at depth. Carry fine grained particles out of surf zone to deeper water.

Hydrological Cycle and Glaciation

Glacial Periods:

- Low standing seas
- Ice accumulation on continents

Interglacial Periods:

- High standing seas
- Little or no ice accumulation on continents

Relative Sea Level Changes in NAM

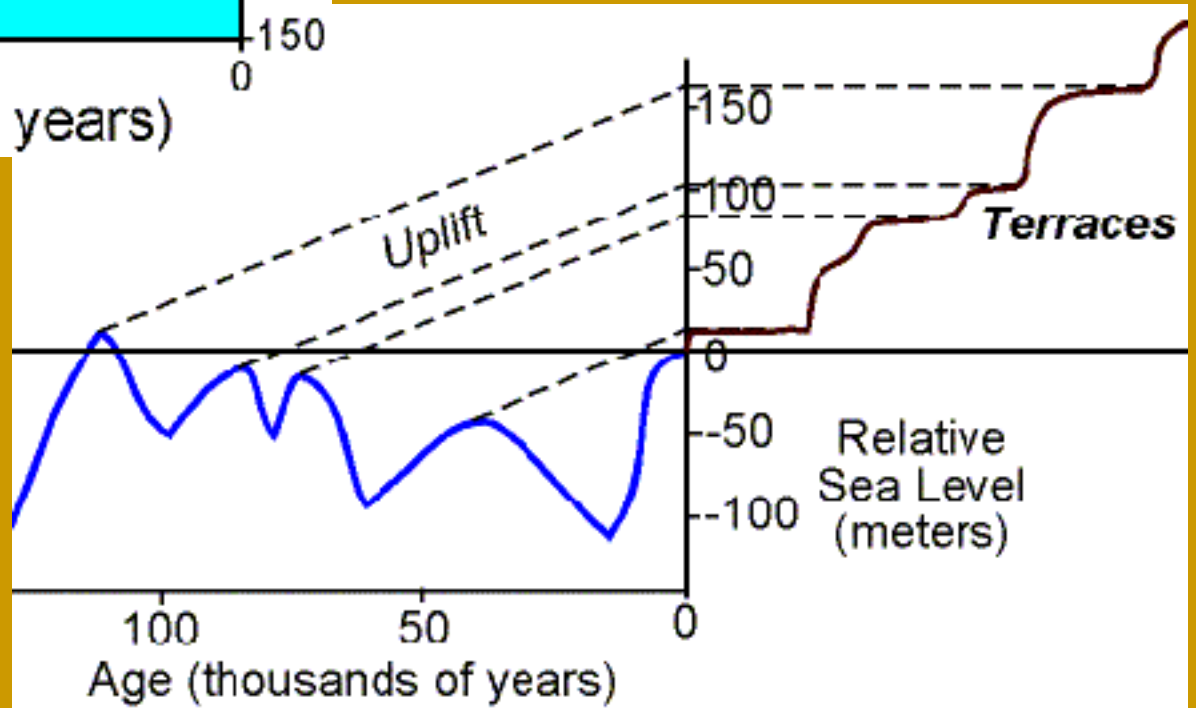

Image source: <http://www.homepage.montana.edu/~geol445/hyperglac/eustasy1/>

Marine Terraces and Sea Level

Summary of Sea Level Changes

- Sea level has risen 130 m in last 15 ka due to melting of Pleistocene glaciers.
- Initially rate was **rapid**, ~ 1.3 m/100 year, but in last 3000 years it **slowed** to about 0.04 m/100 year.
- Since 1930, sea level rise has again **increased** and now is ~ 0.24 m/100 year or 2.4 mm/yr along Atlantic and Gulf coasts.
- Suggested causes include **Global Warming** due to **Greenhouse** gas emissions and increased glacial melting in response.
